

Workflow Purpose

This workflow scrapes TikTok video data using Apify, then uses a GPT-based AI Agent to extract marketing insights from the video transcripts. It identifies problems, solutions, pain points, desired outcomes, and direct quotes related to a search keyword.

Workflow Setup Guide

1. Import the Workflow

- Open your n8n instance.
- Click **Workflows > Import**.
- Choose the `TikTok_Marketing_Insights.json` file and import it.

2. Configure User Inputs

This workflow relies on user input for:

- **Keyword To Scrape** – e.g., "fitness", "budgeting", "acne skincare".
- **How Many Videos** – how many TikTok videos you want to scrape.

These should be passed through a UI node like a form trigger or initialized manually using a Set node for testing.

Workflow Node Breakdown

Node 1: Scrape TikTok (Apify)

- **Type:** HTTP Request Node
- **Action:** Sends a POST request to the Apify TikTok Scraper actor.
- **Inputs:**

- Keyword and number of videos are dynamically injected using `{{ $json[... ] }}` expressions.
- **Output:** A dataset of TikTok video metadata including `transcript`.

Node 2: AI Agent

- **Type:** Langchain AI Agent (GPT-4o Mini)
 - **Action:** Analyzes each TikTok transcript to classify and extract:
 - Problem/Solution
 - Pain Points
 - Desired Outcomes
 - Triggers
 - Interesting Quotes
 - **Input Prompt** includes structured analysis directives using the keyword provided.
-

How to Customize or Extend

- **Transcript Extraction:** Ensure each item includes a `transcript` field. If not present, consider integrating Whisper or a TikTok transcript API.
 - **AI Prompt Tweaks:** Modify the prompt in the AI Agent node to focus on different marketing angles (e.g., tone of voice, target audience).
 - **Store Results:** Add a Google Sheets or Notion node to store or report insights.
-

Pre-Use Checklist

1. Replace `apify_api_...` token with your valid Apify API token.

2. Make sure the input data (keyword, video count) is populated.
3. Review node execution to verify that TikTok responses include valid transcripts.
4. Ensure your n8n instance supports the Langchain AI Agent node (Cloud or paid plan).
